

Keys to the macrolichens and checklist of the lichens and lichenicolous fungi of New Guinea

A. Aptroot, 2009

New Guinea has the richest macrolichen flora of any tropical Asian country. Although the 1986 checklist mentions only relatively few endemics, increased research in especially the last decade of the last century has shown that many of the conspicuous macrolichens were undescribed and, indeed, endemic. There have been a few larger general publications and several smaller devoted to separate genera, and by now we can assume that most species are found and described.

1. Keys to the macrolichens

To provide an overview of the current state of knowledge, a key to the macrolichens is provided here. This set of keys is mostly a compilation of published work by various authors, but contains some original keys for groups that were not yet treated in detail. The different sources of the keys has led to a rather varied terminology, which has not forcibly been homogenized. The key treats foliose and fruticose lichens, but not squamulose or crustose ones; some arguably arbitrary choices as to inclusion have been made.

Thallus fruticose: Key A

Thallus foliose: Key B

Key A: Fruticose lichens

- 1a.** Thallus yellow to orange-red, K+ purple-red **2**
- 1b.** Thallus variously coloured, if yellow to orange-red then not K+ purple-red **3**

- 2a.** Thallus of small, flattened, compacted lobes, to 1 mm wide and 2 mm tall, without marginal fibrils; marginal soredia present *Xanthoria*
- 2b.** Thallus either entirely terete, angular, richly branched and with small oval soralia, sterile, or with ± flattened lobes, to 2.5 mm wide with numerous marginal fibrils; without soralia, and often fertile *Teloschistes flavicans*

- 3a.** Thallus dimorphic, with a crustose, leprose or squamulose basal thallus from which arises an erect, secondary thallus with or without apothecia **4**
- 3b.** Thallus not dimorphic **6**

- 4a.** Basal thallus crustose, leprose or granular *Leprocaulon*
- 4b.** Basal thallus squamulose or of rounded, peltate or flattened phyllocladia (sometimes disappearing early) **5**

- 5a.** Erect thallus hollow, often with squamules (at least at the base) and cups; phyllocladia and cephalodia absent; ascospores simple *Cladonia*

- 5b.** Erect thallus solid, without cups and squamules; granular, peltate or finger-like; phyllocladia often sessile, wrinkled to convoluted, pale brown to blackish cephalodia present; ascospores septate *Stereocaulon*
- 6a.** Thallus flattened, strap-shaped, distinctly dorsiventral (with differently coloured upper and lower surface); algae concentrated near the upper surface only 7
- 6b.** Thallus not flattened, terete or, if flattened, algae distributed on both lower and upper sides 10
- 7a.** Thallus of straps; marginal cilia present 8
- 7b.** Thallus of combs; marginal cilia absent 9
- 8a.** Lower surface not corticate *Heterodermia*
- 8b.** Lower surface corticate *Everniastrum*
- 9a.** Algae blue-green *Dictyonema*
- 9b.** Algae green *Coenogonium*
- 10a.** Thallus gelatinous, dark green- to brown-black or black; photobiont blue-green. 11
- 10b.** Thallus not gelatinous, colour various; photobiont various 12
- 11a.** Thallus without an upper cortex (microscope); thallus usually brown- or green-black *Collema*
- 11b.** Thallus with an upper cortex consisting of a single layer of cells (microscope); thallus usually blue-grey, brown or grey-black *Leptogium*
- 12a.** Thallus with blue-green algae, to c. 1 cm tall, consisting of very slender, minutely tufted, spreading filaments 13
- 12b.** Thallus with green algae, c. 1-20 cm tall, filamentous or otherwise 15
- 13a.** Thallus richly branched, ± erect, brown to black 14
- 13b.** Thallus little branched, ± decumbent; blue-green if erect *Dictyonema*
- 14a.** Surface shiny; surface cells mosaic-forming *Polychidium*
- 14b.** Surface matt, tomentose near the base; surface cells rounded.
..... *Dendriscocaulon* (unidentifiable morphs of *Sticta*)
- 15a.** Thallus and/or soralia C+ red; exclusively coastal, firmly attached to rock or bark, coastal; photobiont Trentepohlia *Roccella montagnei*
- 15b.** Thallus and soralia (if present) C-; ecology various 16
- 16a.** Thallus filamentous, with a tough axial strand, not easily broken when branches are pulled; ascospores simple *Usnea*
- 16b.** Thallus filamentous or otherwise, without a tough, axial strand (breaking cleanly when pulled apart) 17
- 17a.** Thallus thread-like, with thin, often pointed, apices 18
- 17b.** Thallus not thread-like, apices mostly blunt 19

- 18a.** Thallus with distinct, white, ± elongate, often convex pseudocyphellae; yellow-grey *Alectoria ochroleuca*
- 18b.** Thallus with or without indistinct pseudocyphellae which are never convex; colour black..... *Bryoria*
- 19a.** Thallus some shade of brown, with elongated perforations *Cladonia aggregata*
- 19b.** Thallus not brown or not with perforations **20**
- 20a.** Thallus yellow-grey or yellow-green..... **21**
- 20b.** Thallus white to greyish or brownish..... **23**
- 21a.** Thallus with cartilaginous strands; apothecia when present with disc ± concolorous with the thallus *Ramalina*
- 21b.** Thallus without cartilaginous strands; apothecia when present with red or dark disc **22**
- 22a.** Thallus solid, wrinkled and lacunose with wavy margins *Flavocetraria nivalis*
- 22b.** Thallus hollow, without wrinkles or lacunose with wavy margins *Cladonia*
- 23a.** Thallus only a hollow or solid strap, without much branching except for at the tips, without apothecia, usually white..... **24**
- 23b.** Thallus branched in some kind **25**
- 24a.** Thallus somewhat branched..... *Siphula*
- 24b.** Thallus virtually unbranched *Thamnolia*
- 25a.** Branches hollow..... **26**
- 25b.** Branches solid..... **28**
- 26a.** Thallus terete..... *Cladonia*
- 26b.** Thallus somewhat flattened **27**
- 27a.** Lower surface of thallus not blackened; thallus often with terminal apothecia; cortex K-..... *Ramalina*
- 27b.** Lower surface of thallus partly blackened; apothecia rare, not terminal; cortex K+ yellow..... *Hypogymnia*
- 28a.** Thallus often with cephalodia and/or soralia; apothecia with dark brown disc; sphaerophorin absent *Stereocaulon*
- 28b.** Thallus without cephalodia or soralia **29**
- 29a.** Apothecia forming black powdery mazaedium *Bunodophoron*
- 29b.** Apothecia firm **30**
- 30a.** Thallus partly flattened; apothecia at the ontogenetically lower surface. *Calathaspis devexa*
- 30b.** Thallus mostly in radial orientation on little twigs; apothecia terminal *Compsocladium archboldianum*

Key B: Foliose lichens

- 1a. Thallus yellow..... 2
1b. Thallus not yellow..... 3
- 2a. Thallus K-, lobes very small, 0.3-0.5(-1.5) mm wide..... *Candelaria crawfordii*
2b. Thallus K+ red, lobes more than 2 mm wide..... *Xanthoria*
- 3a. Photobiont in thallus mainly blue-green (cyanobacterial)..... 4
3b. Photobiont in thallus mainly green (chlorococcoid)..... 19
- 4a. Thallus not layered in cross-section (homoiomericous); thallus blue-grey or brown throughout..... 5
4b. Thallus layered in cross-section (heteromericous); upper and lower surfaces distinctly different..... 8
- 5a. Thallus without a cellular upper cortex (microscope); swelling rapidly when wet. 6
5b. Upper cortex of a single layer of well-defined cells (microscope), thallus not swollen when wet..... *Leptogium*
- 6a. Thallus bluish, without apothecia *Kroswia crystallifera*
6b. Thallus brown, often with apothecia..... 7
- 7a. Ascospore simple; thallus very thick *Physma*
7b. Ascospores septate *Collema*
- 8a. Thallus squamulose or placodioid, often with blue-black prothallus 9
8b. Thallus foliose..... 12
- 9a. Thallus plate-like, Pd-; thalline excipie absent *Degelia*
9b. Thallus with distinct lobes 10
- 10a. Thallus mainly brown; hymenium I+ blue turnig brown..... *Fuscopannaria*
10b. Thallus mainly grey; hymenium I+ persistently blue 11
- 11a. Thallus always PD-; asci with internal amyloid ring structure..... *Parmeliella*
11b. Thallus often PD+; asci without internal amyloid structure *Pannaria*
- 12a. Thallus closely applied to substrate and usually under 3 cm wide 13
12b. Thallus ascending and free from substrate except of attachment structures..... 15
- 13a. Thallus with stiff hairs, mostly PD+ orange; apothecia marginal *Erioderma*
13b. Thallus with arachnoid hairs or glabrous, always PD-; apothecia laminal 14
- 14a. Thallus bluish, upper surface smooth; asci with I+ blue cap *Coccocarpia*
14a. Thallus bluish, upper surface cob-webby; asci with I+ blue cap *Leioderma*
14b. Thallus brownish, upper surface smooth; asci without I+ blue cap.....
..... *Fuscoderma papuanorum*
- 15a. Cyphellae or pseudocyphellae present on lower surface 16

- 15b.** Cyphellae and pseudocyphellae absent from lower surface, but bald patches may be present amongst the tomentum..... **17**
- 16a.** Cyphellae present with distinct raised margins, thallus smelling of fish when wet..... *Sticta*
- 16b.** Pseudocyphellae present without distinct raised margins, thallus not smelling of fish when wet..... *Pseudocypbellaria*
- 17a.** Lower surface naked or sparingly tomentose (but tomentose in two extinct species), apothecia (if present) on lower surface of lobe ends *Nephroma*
- 17b.** Lower surface tomentose, apothecia (if present) on upper surface of thallus or lobe ends **18**
- 18a.** Lower surface with a ± well-developed coarse network of white or brown veins; apothecia (if present) on short marginal projections..... *Peltigera*
- 18b.** Lower surface without veins, but with bald patches amongst the tomentum; apothecia (if present) laminal..... *Lobaria*
- 19a.** Thallus with spongiostatum (dense sponge-like cushions on lower surface)..... **20**
- 19b.** Thallus without spongiostatum..... **21**
- 20a.** Upper surface yellowish, with usnic acid *Pannoparmelia angustata*
- 20b.** Upper surface grey, without usnic acid..... *Anzia*
- 21a.** Thallus lobes inflated, hollow in section, lower surface without rhizines..... **22**
- 21b.** Thallus lobes solid in section, flat or convex..... **23**
- 22a.** Thallus without perforations on the upper surface *Hypogymnia*
- 22b.** Thallus with perforations on the upper or lower surface *Menegazzia*
- 23a.** Lobes with tomentum on lower surface, with or without lower cortex **24**
- 23b.** Lobes with distinct lower cortex, tomentum absent **28**
- 24a.** Thallus lobes rounded, with a single urceolate apothecia ± immersed in the centre of the thallus or if absent lower surface orange and without distinct veins.
..... *Solorina simensis*
- 24b.** Thallus lobes spreading, or if rounded then with distinct raised veins; apothecia if present on margins of the thallus **25**
- 25a.** Lobes without a lower cortex; rhizines often conspicuous to the margin... *Peltigera*
- 25b.** Lobes with a distinct lower cortex; rhizines absent from the margin of the lower surface **26**
- 26a.** Cyphellae and pseudocyphellae absent on lower surface *Lobaria*
- 26b.** Cyphellae or pseudocyphellae present on lower surface **27**
- 27a.** Cyphellae white, with distinct raised margins present on lower surface..... *Sticta*
- 27b.** Pseudocyphellae present as punctiform or effigurate breaks in the lower cortex.
..... *Pseudocypbellaria*

- 28a.** Thallus in the centre not foliose; only along the margins **29**
28b. Thallus foliose throughout **30**
- 29a.** Hymenium I+ bright blue *Pannaria*
29b. Hymenium I+ dirty blue *Psoroma filicicola*
- 30a.** Thallus white, grey or brownish grey, lobes up to 5 mm wide, usually matt, often pruinose; spores brown, 1-septate (Physciaceae) **31**
30b. Thallus yellow-green, grey or brown, lobes from 1 mm to several centimetres wide, usually ± shiny in younger parts, rarely pruinose; spores colourless, simple (Parmeliaceae) **36**
- 31a.** Thallus whitish to bluish grey, K+ yellow **32**
31b. Thallus grey brown to brown, K- **35**
- 32a.** Rhizines nearly absent; medulla UV+ white *Dirinaria*
32b. Rhizines present; medulla UV- **33**
- 33a.** Thallus with marginal cilia or rhizines; upper cortex and hyphae running parallel to the upper surface (microscope) *Heterodermia*
33b. Thallus without marginal rhizines or cilia; upper cortex and hyphae with a cellular structure (microscope) **34**
- 34a.** Hypothecium black; lower surface usually black; thallus often UV+ yellow *Pyxine*
34b. Hypothecium pale; lower surface white to black; thallus UV- *Physcia*
- 35a.** Rhizines absent or sparse *Hyperphyscia adglutinata*
35b. Rhizines numerous *Phaeophyscia*
- 36a.** Cilia with inflated base **37**
36b. Cilia, if present, without inflated base **38**
- 37a.** Upper surface grey, K+ yellow, with atranorin *Bulbothrix*
37b. Upper surface yellowish green, with usnic acid *Relicina*
- 38a.** Thallus erect, ± tufted **39**
38b. Thallus adnate to loosely overlapping **40**
- 39a.** Thallus lobes brown throughout *Cetraria*
39b. Thallus lobes yellow-green, green to grey-green or whitish.... *Flavocetraria nivalis*
- 40a.** Pseudocyphellae present on upper surface, punctiform or effigurate..... **41**
40b. Pseudocyphellae absent **43**
- 41a.** Pseudocyphellae effigurate *Parmelia erumpens*
41b. Pseudocyphellae punctiform **42**
- 42a.** Lobes overlapping, apothecia usually absent..... *Cetrelia*
42b. Lobes not overlapping, apothecia often present *Nephromopsis*

43a. Rhizines branched dichotomous or squarrose (simple rhizines may also be present)	<i>Hypotrachyna</i>
43b. Rhizines simple (or at most forked).....	44
44a. Thallus closely appressed to substratum.....	45
44b. Thallus not appressed to substratum, with loosely overlapping lobes.....	47
45a. Cilia present	<i>Hypotrachyna</i> Key
45b. Cilia absent.....	46
46a. Thallus closely appressed on rock	<i>Xanthoparmelia</i>
46b. Thallus closely appressed on rock	<i>Relicinopsis</i>
47a. Thallus grey-green (usnic acid absent)	48
47b. Thallus yellow-green (usnic acid present)	50
48a. Cilia present	49
48b. Cilia absent.....	<i>Canoparmelia</i>
49a. Rhizines branched dichotomous or squarrose (simple rhizines may also be present)	<i>Hypotrachyna</i> Key
49b. Rhizines simple (or at most forked), often absent along the lower margin	<i>Parmotrema</i> Key
50a. Thallus with discrete or pustular soralia	<i>Flavoparmelia haysomii</i>
50b. Thallus without soralia; isidia sometimes present	<i>Xanthoparmelia</i>
 Anzia Key (after Yoshimura, I., H.J.M. Sipman & A. Aptroot 1995. The lichen genus <i>Anzia</i> in New Guinea. <i>Bibliotheca Lichenologica</i> 58: 439-469.):	
1a. Without lobules, isidia, pustules or soredia; apothecia often present.....	2
1b. With lobules, isidia, pustules or soredia; apothecia usually absent	5
2a. Spongiostromat moniliform, in interrupted, rounded patches <i>A. pseudoangustata</i>	
2b. Spongiostromat not moniliform, in a continuous band.....	3
3a. Upper surface of lobes ± convex; white marginal rim mostly absent; central cavity between spongiostromat and medulla present; medulla C+ red or rarely C-, with or without anziaic acid	<i>A. gregoriana</i>
3b. Upper surface of lobes ± flat; white marginal rim present; spongiostromat without cavities; medulla C+ red or (usually) C-, with or without anziaic acid	4
4a. Medulla C-, with lobaric acid or norlobaridone, without anziaic acid, never with yellow pigment.....	<i>A. semiteres</i>
4b. Medulla C+ red, with anziaic acid, sometimes with yellow pigment. <i>A. endoflavida</i>	
4c. Medulla C+red, with anziaic acid and 4-O-methylhypoprotocetraric acid.....	<i>A. niuginiensis</i>
5a. With lobules or cylindrical isidia.....	6
5b. With soralia or pustules	10

- 6a.** With lobules 7
- 6b.** With cylindrical isidia 8
- 7a.** Upper surface of lobes ± flat; white marginal rim present; spongiostratum without cavities; medulla C-, with lobaric acid *A. ornatoides*
- 7b.** Upper surface of lobes ± convex; white marginal rim often absent; central cavity between spongiostratum and medulla present; medulla C+ red, with anziaic acid.
..... *A. pseudopustulata*
- 8a.** Upper surface of lobes ± convex; white marginal rim often absent; central cavity between spongiostratum and medulla present; medulla C+ red, with anziaic acid.
..... *A. corallophora*
- 8b.** Upper surface of lobes ± flat; white marginal rim present; spongiostratum without cavities 9
- 9a.** Isidia c. 0.1 mm wide and up to c. 0.4 mm long, with browned tips, rarely branched, when young club-shaped; medulla C+ yellow-orange, with lobaric acid and identified substances *A. isidiolenta*
- 9b.** Isidia c. 0.1-0.3 mm wide and c. 0.5-1.2 mm long, without browned tips, more or less branched, not club-shaped; medulla C-, with norlobaridone or lobaric acid, occasionally without *A. isidiosa*
- 10a.** With soralia; medulla C-, UV+ white, with divaricatic acid 11
- 10b.** With pustules; medulla C+ red, LTV-, with anziaic acid 12
- 11a.** With bubble- to urn-shaped, laminal soralia *A. afromontana*
- 11b.** With labriform soralia on the lower side of recurved lobe tips *A. americana*
- 12a.** Pustules mostly terminal, producing coarse soredia or tiny, coralloid lobules; upper surface of lobes ± flat; white marginal rim present; spongiostratum without cavities *A. pustulata*
- 12b.** Pustules mostly lateral, producing convex lobules; upper surface of lobes ± convex; white marginal rim present; spongiostratum with central cavity between spongiostratum and medulla *A. pseudopustulata*

Bryoria Key:

- 1a.** Thallus sorediate *B. dahlii*
- 1b.** Thallus not sorediate *B. indonesica*

Bulbothrix Key:

- 1a.** Thallus without isidia or lobules *B. tuskiformis*
- 1b.** Thallus with isidia or lobules 2
- 2a.** Lobes black below, relatively broad *B. tabacina*
- 2b.** Lobes brown below, narrow 3
- 3a.** Medulla C+ pink *B. goebelii*

- 3b.** Medulla C- 4
- 4a.** Medulla P+ yellow, K+ red (salazinic) *B. isidiza*
- 4b.** Medulla P+ red (protocetraric) *B. subinflata*

Bunodophoron Key:

- 1a.** Thallus hollow *B. diplotypus*
- 1b.** Thallus solid 2
- 2a.** Branched thin, less than 2 mm wide *B. murrayi*
- 2b.** Branches thick, more than 2 mm wide *B. patagonicus*

Canoparmelia Key:

- 1a.** Thallus isidiate *C. adspersa*
- 1b.** Thallus sorediate *C. texana*

Cetraria Key:

- 1a.** Thallus broad; lobes usually over 2 mm wide *C. islandica*
- 1b.** Thallus narrow; lobes usually under 2 mm wide *C. nigricans*

Cetrelia Key:

- 1a.** With (mostly marginal) soredia; medulla UV+ or UV- 2
- 1b.** With (mostly marginal) isidia or lobuli; medulla UV+ white 3
- 2a.** Medulla C+ red, UV- (olivetric acid) *C. olivetorum*
- 2b.** Medulla C-, KC+ reddish, UV+ white (alectoronic acid) *C. chicitae*
- 3a.** With (usually short) isidia (alectoronic acid) *C. braunsiana*
- 3b.** With marginal lobules (microphyllinic acid) *C. japonica*

Cladonia Key (after Stenroos, S. 1986). The family Cladoniaceae in Melanesia. 2. *Cladonia* section *Cocciferae*. Annales Botanici Fennici 23: 239-250. and **Stenroos, S. 1988a.** The family Cladoniaceae in Melanesia. 3. *Cladonia* sections *Helopodium*, *Perviae* and *Cladonia*. Annales Botanici Fennici 25: 117-148.):

- 1a.** Thallus without squamules 2
- 1b.** At least some squamules present 3
- 2a.** Thallus inflated, little branched *C. papuana*
- 2b.** Thallus not inflated, densely (at least 5 times) branched *C. confusa*
- 3a.** Podetial axils, scyphi and often tips open 4
- 3b.** Podetial axils, scyphi and tips closed 7
- 4a.** Podetia richly branched; contains fumarprotocetraric acid (PD+ red) 5

- 4b.** Podetia moderately branched; contains thamnolic or squamatic acid (PD+ yellow or PD-) 6
- 5a.** Podetial walls with lateral fissures and perforations, stereome thin *C. corymbescens*
- 5b.** Fissures and perforations lacking, stereome thick and hard *C. scabriuscula*
- 6a.** Surface of the podetia smoothly corticate, sometimes with few microsquamules, medulla UV- *C. crispata*
- 6b.** Surface of the podetia rough, microsquamulose, medulla often UV+ white.
..... *C. squamosa*
- 7a.** Apothecia when present brown; lower surface of squamules without yellow 8
- 7b.** Apothecia when present red; lower surface of squamules often partly yellow 27
- 8a.** Podetia ascophose, blunt, esorediate, commonly terminating in hymenial discs 9
- 8b.** Podetia scyphose or if ascophose, then usually subulate, sorediate and without hymenial discs..... 10
- 9a.** Basal squamules small; contains fumarprotocetraric acid (PD+ red) *C. peziziformis*
- 9b.** Basal squamules large; contains psoromic acid (PD+ yellow, K-)... *C. macrophylla*
- 9c.** Basal squamules large; contains norstictic acid (K+red)..... *C. polycarpoides*
- 10a.** Podetia at least partly sorediate..... 11
- 10b.** Podetia esorediate, smoothly corticate to squamulose..... 19
- 11a.** Podetia lacking scyphi 12
- 11b.** Podetia bearing distinct scyphi 14
- 12a.** Podetia sorediate throughout, not or scarcely melanotic 13
- 12b.** Podetia esorediate, melanotic, verruculose *C. melanocaulis*
- 13a.** Podetia repeatedly branched, soredia coarse, caducous..... *C. corniculata*
- 13b.** Podetia simple or with few branches; soredia finely granulose, immixed with microsquamules *C. subradiata*
- 14a.** Podetia entirely sorediate, scyphi wide..... 15
- 14b.** Podetia partly corticate 16
- 15a.** Soredia farinose to finely granulose, immixed with microsquamules down to base *C. subsquamosa*
- 15b.** Soredia granulose..... *C. chlorophaea*
- 16a.** Scyphi narrow (0.5-1.5 mm), soralia tuberculate, partly epicorticate; podetia pale greenish-brown *C. phyllopora*
- 16b.** Scyphi generally wider (1-4 mm), soredia not tuberculate..... 17
- 17a.** Scyphi deep, often with fundic perforations *C. poeciloclada*
- 17b.** Scyphi shallow, closed..... 18

- 18a.** Scyphi generally well developed; soredia farinose, in patches, confined to the scyphal margins; podetia medium to dark brown; contains fumarprotocetraric acid (PD+red) *C. ochrochlora*
- 18b.** Scyphi often deformed, soredia powdery to granulose; contains fumarprotocetraric (PD+ red) or psoromic acid (PD+ yellow)..... *C. fruticulosa*
- 19a.** Podetia lacking scyphi **20**
- 19b.** Podetia with scyphi **22**
- 20a.** Podetia richly branched..... **5**
- 20b.** Podetia simple or moderately branched..... **21**
- 21a.** Podetial surface smooth; walls with lateral slits *C. fenestralis*
- 21b.** Podetial surface roughly microsquamulose *C. ramulosa*
- 22a.** Scyphi proliferating from the centre **23**
- 22b.** Scyphi proliferating from the margins..... **25**
- 23a.** Scyphi deformed, irregular, sparsely present..... *C. fenestralis*
- 23b.** Scyphi regular, well developed..... **24**
- 24a.** Surface of the podetia smoothly corticate, scyphi wide *C. rappii*
- 24b.** Surface of the podetia partly ecorcicate, squamulose; scyphi narrow. *C. gymnopoda*
- 25a.** Surface of the podetia smooth; walls with lateral slits *C. fenestralis*
- 25b.** Surface of the podetia granulose to microsquamulose **26**
- 26a.** Surface of the podetia granulose to phyllidoid, basal squamules thick, chalk-white inside *C. pocillum*
- 26b.** Surface of the podetia roughly microsquamulose..... *C. ramulosa* s.l.
- 27a.** Podetia scyphose..... **28**
- 27b.** Podetia ascycophose, tips subulate **30**
- 28a.** Podetia sorediate *C. yunnana*
- 28b.** Podetia not sorediate **29**
- 29a.** Podetia provided with regular, wide scyphi; podetial stalk corticate; scyphi areolate-corticate; contains zeorin *C. coccifera*
- 29b.** Podetia with irregularly proliferating scyphi; basal part, as well as the interior of the scyphi corticate; contains thamnolic acid *C. vulcani*
- 30a.** Podetia often without hymenia; at least partly farinose sorediate **31**
- 30b.** Podetia often with hymenial discs; esorediate, squamulose or partly corticate.... **32**
- 31a.** Podetia entirely ecorcicate..... *C. macilenta*
- 31b.** Podetia distinctly corticate at lower parts, cortex often covering one third of the podetia..... *C. weymouthii*

- 32a.** Podetia ecorticate, microsquamulose to partly granulose; squamules narrow, generally pointing downwards..... *C. didyma*
- 32b.** Podetia distinctly corticate at base and below hymenia, other parts ecorticate, scabrose to finely granulose..... *C. floerkeana*

Coccocarpia Key:

- 1a.** Lobes slender (less than 0.5 mm wide), not appressed..... **2**
- 1b.** Lobes broader, or closely appressed..... **4**
- 2a.** Lobes cuneate, with accessory lobes *C. rottleri*
- 2b.** Lobes filiform **3**
- 3a.** Thallus with isidia..... *C. domingensis*
- 3b.** Thallus without isidia..... *C. tenuissima*
- 4a.** Thallus pruinose (compare with the other, common species)..... **5**
- 4b.** Thallus not pruinose; here all common species **6**
- 5a.** Thallus with isidia..... *C. smaragdina*
- 5b.** Thallus without isidia..... *C. pruinosa*
- 6a.** Thallus with isidia..... **7**
- 6b.** Thallus without isidia..... **10**
- 7a.** Thallus tightly adnate, isidia cylindrical..... **8**
- 7b.** Thallus loosely appressed, isidia flattened..... **9**
- 8a.** Lobes cuneate, richly branched..... *C. dissecta*
- 8b.** Lobes rounded, sparingly branched *C. palmicola*
- 9a.** Lobe margins upturned, lobes elongate *C. glauicina*
- 9b.** Lobe margin flat, lobes rounded *C. pellita*
- 10a.** Thallus tightly adnate..... **11**
- 10b.** Thallus loosely appressed *C. erythroxyli*
- 11a.** Follicolous, lobes tips rounded *C. aeruginosa*
- 11b.** Corticolous, lobes tips truncate..... *C. adnata*

Coenogonium Key (only fruticose species):

- 1a.** Spores simple..... *C. leprieurii*
- 1b.** Spores 1-septate *C. linkii*

Collema Key:

- 1a.** Thallus isidiate **2**
- 1b.** Thallus without isidia, with apothecia **3**

- 2a.** Thallus not lobed around the margin *C. leptaleum* var. *biliosum*
- 2b.** Thallus conspicuously lobed..... *C. rugosum*
- 3a.** Thallus rough, not lobed around the margin..... 4
- 3b.** Thallus smooth or with ridges, conspicuously lobed..... 7
- 4a.** Spores 4-celled, thallus pale brownish..... *C. leptaleum*
- 4b.** Spores many-celled, thallus brown to black 5
- 5a.** Apothecia with thick layer of paraplectenchymatous cells..... *C. coilocarpum*
- 5b.** Apothecia without such a layer..... 6
- 6a.** Thallus dark brown to black, excipulum with thick-walled cells, spores mostly < 100 µm *C. papuanorum*
- 6b.** Thallus medium brown, excipulum with thin-walled cells, spores often > 100 µm. *C. fasciculare* var. *microcarpum*
- 7a.** Thallus with ridges, sometimes fenestrate, spores acicular *C. actinoptychum*
- 7b.** Thallus smooth, resembling a Leptogium..... 8
- 8a.** Spores submuriform..... *C. subconveniens*
- 8b.** Spores acicular *C. chimbuense*

Degelia Key:

- 1a.** Thallus sorediate *D. sorediata*
- 1b.** Thallus not sorediate *D. minor*

Dictyonema Key:

- 1a.** Hyphae with clamps..... 2
- 1b.** Hyphae without clamps..... 3
- 2a.** Thallus crustose, corticiod *D. irpicinum*
- 2b.** Thallus nearly foliose, stereoid *D. ligulatum*
- 3a.** Algal trichome uniseriate..... *D. sericeum*
- 3b.** Algal trichome biserrate *D. moorei*

Dirinaria Key:

- 1a.** Thallus with isidia or soredia..... 2
- 1b.** Thallus without vegetative propagules 5
- 2a.** Thallus with isidia..... *D. papillulifera*
- 2b.** Thallus with soredia..... 3
- 3a.** Soredia pustular *D. aegialita*
- 3b.** Soredia rounded, regular..... 4

- 4a. Lobes placodioid, confluent *D. appianata*
- 4b. Lobes discrete, adnate *D. picta*

- 5a. Lobes placodioid, confluent *D. confluens*
- 5b. Lobes discrete, adnate *D. purpurascens*

Erioderma Key (after Jørgensen, P.M. & H.J.M. Sipman 2002a. The lichen genus

Erioderma in Southeast Asia. Ann. Bot. Fennici 39: 201-211.):

- 1a. Thallus sorediate, rarely fertile *E. sorediatum*
- 1b. Thallus not sorediate, usually fertile 2

- 2a. Lower surface with distinct, raised veins, upper scrobiculate, mostly Pd- *E. tomentosum*
- 2b. Lower surface not veined, upper smooth, mostly Pd+ 3

- 3a. Lower surface orange, K+ orange; apothecial margins hairy, hairs often blackish *E. gloriosum*
- 3b. Lower surface creamish white, K-; apothecial margins warted or hairy, hairs whitish only 4

- 4a. Lobes narrow (<3 mm), convex, scabrous, lined by dense brown rhizohyphae, mainly containing vicanicin; apothecia terminal *E. phaeorhizum*
- 4b. Lobes broader (>3 mm), flat to concave, hairy with scattered marginal, black rhizohyphae 5

- 5a. Thallus broad-lobed with coarse, erect, bundled hairs, apothecia finally large (>5 mm) 6
- 5b. Thallus dichotomously divided, downy hairy or glabrous, apothecia smaller(<5 mm) *E. confusum*

- 6a. Thallus coriaceus with long, soft hairs, PD+ faintly yellow (allorhizin and barbatic acid derivates), Mt. Albert Edward only *E. barbellatum* ssp. *coriaceum*
- 6b. Thallus softer mainly with stout, short hairs, PD+ orange (argopsin), widespread *E. pellitum*

Everniastrum Key:

- 1a. With isidia *E. vexans*
- 1b. Without isidia 2

- 2a. Without soredia *E. cirrhatum*
- 2b. With soredia 3

- 3a. Medulla C+ red, K- *E. catawbiense*
- 3b. Medulla C-, K+ red *E. soroccheilum*

- Fuscopannaria** Key (after Jørgensen, P.M. & H.J.M. Sipman 2006. The lichen family Pannariaceae in the montane regions of New Guinea. Journal of the Hattori Botanical Laboratory 100: 695-720.):
- 1a. Thallus with bluish gymnidia (isidia without cortex) *F. coerulescens*
 1b. Thallus without gymnidia 2
- 2a. Squamules large (to 5 mm), uniformly coloured, widely scattered on prothallus. *F. venusta*
 2b. Squamules smaller (to 2 mm), often white-edged, mostly cushion-forming 3
- 3a. Squamules ca. 300 µm thick, imbricate, in cushions, spores 15-18 x 9-12 µm; on high-alpine soils *F. cacuminum*
 3b. Squamules under 200 µm thick, partly ascending, spores 10-12 x 8-10 µm; on rotting bark in humid forest *F. dissecta*
- Heterodermia** Key:
- 1a. Lower surface corticate 2
 1b. Lower surface not corticate 6
- 2a. Thallus with soredia or isidia 3
 2b. Thallus without vegetative propagules *H. diademata*
- 3a. Thallus with isidia 4
 3b. Thallus with soredia 5
- 4a. Thallus firm, thick, like *H. speciosa*, medulla K- *H. isidiophora*
 4b. Thallus lax, thin, medulla K+ red *H. antillarum*
- 5a. Soredia along margins of rather broad lobes *H. albicans*
 5b. Soredia punctiform or covering tiny side-lobes *H. speciosa*
- 6a. Lobes linear, thallus not appressed to the substrate 7
 6b. Lobes rounded to cuneate, more or less appressed 11
- 8a. Lower surface without pigment 9
 8b. Lower surface with pigment 10
- 9a. Thallus irregularly isidiate/sorediate *H. verrucifera*
 9b. Thallus not isidiate *H. leucomela*
- 10a. Lower surface with yellow pigment *H. lutescens*
 10b. Lower surface with red pigment 11
- 11a. Thallus strictly linear *H. papuana*
 11b. Thallus partly deformed, bulging out *H. vulgaris*
- 12a. Thallus white, with unbranched, white cilia 13
 12b. Thallus grey to green, with branched, coloured rhizines 15

13a. Thallus without soredia.....	<i>H. podocarpa</i>
13a. Thallus with soralia.....	14
14a. Soralia labriform to irregular	<i>H. galactophylla</i>
14b. Soralia covering parts of the lower surface.....	<i>H. comosa</i>
15a. Thallus with soredia or irregular isidia/phylloidia.....	16
15b. Thallus without soredia.....	19
16a. Lower surface with pigment	17
16b. Lower surface without pigment	18
17a. Pigment yellow, K-	<i>H. casarettiana</i>
17b. Pigment yellow to orange or red, K+ purple	<i>H. obscurata</i> s.l.
18a. Thallus with irregular isidia/phylloidia.....	<i>H. microphyllina</i>
18b. Thallus with soredia.....	<i>H. japonica</i>
19a. Lower surface with yellow pigment	<i>H. flabellata</i>
19b. Lower surface without pigment	20
20a. Thallus firm, thick, lower margin corticate	<i>H. dactyliza</i>
20b. Thallus lax, thin, lower margin not corticate	<i>H. hypoleuca</i>

Hypogymnia Key:

1a. Thallus with isidia, soralia or pustules.....	2
1b. Thallus without vegetative propagules	5
2a. Thallus soft, with isidia (if firm and with isidia, see <i>Menegazzia</i>)	<i>H. zeylanica</i>
2b. Thallus not soft, with soredia or pustules	3
3a. Soredia labriform, terminal, thallus brownish	<i>H. vittata</i>
3b. Soredia punctiform to confluent and pustular, laminal	4
4a. Soredia punctiform, thallus glossy, brown	<i>H. bitteri</i>
4b. Soredia confluent, pustular, thallus grey.....	<i>H. pseudobitteriana</i>
5a. Thallus brown or partly black, lobes rarely branched.....	<i>H. lugubris</i>
5b. Thallus grey, lobes much branched	<i>H. pectinatula</i>

Hypotrachyna Key (after Louwhoff, S.H.J.J. & J.A. Elix 2002. *Hypotrachyna* and allied lichen genera in Papua New Guinea. *Bibliotheca Lichenologica* 81: 1-149.):

1a. Lobes eciliate	2
1b. Lobes with marginal cilia.....	41
2a. Upper cortex yellow-green; usnic acid present.....	3
2b. Upper cortex grey; atranorin or lichexanthone present.....	13

- 3a.** Thallus lacking isidia, soredia and pustules..... *H. reducens* 4
3b. Thallus with isidia, soredia or pustules..... 4
- 4a.** Thallus sorediate or pustulate; isidia absent 5
4b. Thallus isidiate; isidia cylindrical, ±becoming sorediate..... 8
- 5a.** Thallus pustulate-sorediate *H. meyeri*
5b. Thallus sorediate; pustules absent..... 6
- 6a.** Medulla K- or K+ yellow-brown; fumarprotocetraric acid present....*H. simbuensis*
6b. Medulla K+ yellow turning dark red; salazinic or galbinic acid present..... 7
- 7a.** Medulla containing galbinic acid (major) and salazinic acid (minor) ... *H. galbinica*
7b. Medulla containing salazinic acid (major); galbinic acid absent..... *H. sinuosa*
- 8a.** Medulla K+ yellow then dark red; salazinic, galbinic or norstictic acids present ... 9
8b. Medulla K- or K+ yellow-brown; fumarprotocetraric or physodalic acids present12
- 9a.** Galbinic acid (major or submajor) present *H. microblasta*
9b. Galbinic acid absent..... 10
- 10a.** Norstictic acid (major); salazinic acid absent *H. hnatiukii*
10b. Salazinic acid present..... 11
- 11a.** Salazinic acid (major); norstictic acid (trace) *H. tariensis*
11b. Norstictic acid (major); salazinic acid (submajor)..... *H. andensis*
- 12a.** Upper surface shiny; isidia slender, cylindrical; fumarprotocetraric acid present. *H. munduai*
12b. Upper surface dull; isidia somewhat inflated; physodalic acid present. *H. subphysodalica*
- 13a.** Thallus lacking isidia, soredia and pustules..... 14
13b. Thallus with isidia, soredia or pustules..... 18
- 14a.** Medulla K+ yellow then dark red; salazinic acid present..... *H. corneola*
14b. Medulla K- or K + yellow-brown; salazinic acid absent 15
- 15a.** Medulla P+ orange-red; protocetraric acid present..... *H. adducta*
15b. Medulla P- ; protocetraric acid absent.16
- 16a.** Medulla pale yellow; secalonic acid A present..... *H. peruviana*
16b. Medulla white; secalonic acid A absent..... 17
- 17a.** Upper surface densely lobulate; barbatic and 4-O-demethylbarbatic acids present. *H. neodigitata*
17b. Upper surface elobulate; fatty acids present *H. terricola*
- 18a.** Thallus isidiate; soredia and pustules absent 19
18b. Thallus sorediate and/or pustulate; isidia absent 30

- 19a.** Medulla C+ red; lecanoric acid present *H. woitapensis*
19b. Medulla C-; lecanoric acid absent..... **20**
- 20a.** Medulla P+ orange or red; fumarprotocetraric, protocetraric and/or quaeositic acids present..... **21**
20b. Medulla P-; fumarprotocetraric, protocetraric and quaeositic acids absent..... **24**
- 21a.** Medulla K+ yellow then dark red; quaeositic acid present *H. quae sita*
21b. Medulla K- or K+ yellow-brown; quaeositic acid absent..... **22**
- 22a.** Medulla K-, KC+ orange ; fumarprotocetraric and barbatic acids present.
..... *H. malesiana*
22b. Medulla K+ yellow-brown; KC+ pink; protocetraric acid present..... **23**
- 23a.** Medulla yellow in part; pigmentosin A present..... *H. consimilis*
23b. Medulla white throughout; pigmentosin A absent *H. koyaensis*
- 24a.** Medulla KC+ orange; barbatic acid present **25**
24b. Medulla KC-; fatty acids present **28**
- 25a.** Isidia inflated; apices becoming erumpent *H. toiana*
25b. Isidia cylindrical; apices intact..... **26**
- 26a.** Echinocarpic acid present *H. addita*
26b. Echinocarpic acid absent..... **27**
- 27a.** Upper surface distinctly maculate; obtusatic and norobtusatic acids (submajor) present *H. imbricatula*
27b. Upper surface emaculate; obtusatic and norobtusatic acids present in trace quantities or absent *H. orientalis*
- 28a.** Thallus loosely adnate, saxicolous or terricolous; lobes broad, 4-12 mm wide.
..... *H. terricola*
28b. Thallus adnate, corticolous; lobes narrower, 1-6 mm wide **29**
- 29a.** Lobes narrow, 1-3 mm wide; ascospores large, 20-23 x 12-15 µm; lichesterinic and protolichesterinic acids present *H. lichesterinica*
29b. Lobes broader, 2-6 mm wide; ascospores small, 8-10 x 4-6 µm; constipatic, protoconstipatic and protopraesorediosic acids present *H. costaricensis*
- 30a.** Thallus pustulate-sorediate **31**
30b. Thallus sorediate; pustules absent..... **35**
- 31a.** Upper cortex UV+ yellow; lichexanthone present..... *H. osseoalba*
31b. Upper cortex UV-; lichexanthone absent..... **32**
- 32a.** Thallus laciniate; medulla C+ rose-red; gyrophoric acid present *H. monticola*
32b. Thallus elaciinate; medulla C-; gyrophoric acid absent..... **33**

- 33a.** Medulla lemon-yellow; secalonic acid A present *H. endochlora*
- 33b.** Medulla white; secalonic acid A absent..... **34**
- 34a.** Echinocarpic acid present *H. adjuncta*
- 34b.** Echinocarpic acid absent..... *H. exsecta*
- 35a.** Medulla lemon-yellow; secalonic acid A present *H. endochlora*
- 35b.** Medulla white; secalonic acid A absent..... **36**
- 36a.** Medulla K+ yellow then dark red; salazinic acid present..... **37**
- 36b.** Medulla K- or K+ yellow-brown ; salazinic acid absent **38**
- 37a.** Soralia subterminal on hooded, reflexed lobes; zeorin present *H. majoris*
- 37b.** Soralia subterminal, lobe apices ±flat; zeorin absent..... *H. brevirhiza*
- 38a.** Medulla P+ orange-red; protocetraric acid present..... *H. pseudosinuosa*
- 38b.** Medulla P-; protocetraric acid absent **39**
- 39a.** Medulla C+ pale red; gyrophoric or lecanoric acids present **40**
- 39b.** Medulla C-; lividic acid present..... *H. immaculata*
- 40a.** Rhizines richly dichotomously branched; evernic and lecanoric acids present.
..... *H. rockii*
- 40b.** Rhizines sparsely dichotomously branched; gyrophoric acid present *H. revoluta*
- 41a.** Thallus isidiate; soredia and pustules absent **42**
- 41b.** Thallus sorediate and/or pustulate; isidia absent **45**
- 42a.** Medulla K+ yellow then dark red; salazinic acid present..*Parmelinella wallichiana*
- 42b.** Medulla K- or K+ yellow-brown ; salazinic acid absent **43**
- 43a.** Medulla P+ orange-red; protocetraric acid present....*Parmelinopsis protocetrarica*
- 43b.** Medulla P-; protocetraric acid absent **44**
- 44a.** Isidia ciliate; medulla C-; 3-methoxy-2,4-di-O-methylgyrophoric acid (major).
..... *Parmelinopsis horrescens*
- 44b.** Isidia eciliate; medulla C+ rose; gyrophoric acid (major) ...*Parmelinopsis minarum*
- 45a.** Medulla pale to intense yellow; secalonic acid A present **46**
- 45b.** Medulla white; secalonic acid A absent..... **47**
- 46a.** Pustules sorediate; leucotylic acid present..... *Myelochroa aurulenta*
- 46b.** Pustules esorediate; leucotylic acid absent *Myelochroa nothofagi*
- 47a.** Soralia capitate; pustules absent **48**
- 47b.** Soralia not capitate; pustulate present..... **49**
- 48a.** Medulla K+ yellow then dark red, C-; salazinic acid present..... *H. radiculata*
- 48b.** Medulla K-, C+ rose; gyrophoric acid present *Parmelinopsis cryptochlora*

- 49a.** Medulla C-, KC+ rose; 3-methoxy-2,4-di-O-methylgyrophoric acid (major).
.....*Parmelinopsis subfatiscens*
- 49b.** Medulla C+ rose, KC+ red; gyrophoric acid (major) **50**
- 50a.** Lobes narrow, 0.5-2 mm wide; pustules not or rarely sorediate.
.....*Parmelinopsis spumosa*
- 50b.** Lobes broad, 2-5 mm wide; pustules extensively sorediate.
.....*Parmelinopsis afrorevoluta*

Leioderma Key:

- 1a.** Thallus sorediate *L. sorediatum*
1b. Thallus not sorediate *L. erythrocarpum*

Leprocaulon Key:

- 1a.** Thallus K+ yellow *L. arbuscula*
1b. Thallus K- *L. pseudoarbuscula*

Leptogium Key:

- 1a.** Lower surface with a thick layer of felty rhizinae **2**
1b. Lower surface without, or with short or patchy rhizinae **4**
- 2a.** Thallus with isidia *L. asiaticum*
2b. Thallus without isidia **3**
- 3a.** Apothecia marginal, convex *L. loriforme*
3b. Apothecia laminal and concave, or absent *L. pedicellatum*
- 4a.** Thallus with isidia **5**
4b. Thallus without isidia, sometimes with lobules **9**
- 5a.** Thallus not wrinkled *L. cyanescens*
5b. Thallus wrinkled **6**
- 6a.** Thallus pale brown, gelatinous **7**
6b. Thallus greyish, thinner **8**
- 7a.** Thallus lobate, with raised margins *L. marginellum*
7b. Thallus pulvinate to anastomosing *L. coralloideum*
- 8a.** Isidia marginal, apothecia numerous *L. marginellum*
8b. Isidia laminal, apothecia rare *L. austroamericanum*
- 9a.** Upper surface smooth (stress-wrinkles may occur) **10**
9b. Upper surface wrinkled **14**
- 10a.** Lower surface pubescent, apothecia with marginal lobes *L. burgessii*
10b. Lower surface not pubescent, with or without rhizinae **11**

- 11a.** Thallus purplish brown, very thin.....*L. streimannii*
11b. Thallus grey (in some shade) 12
- 12a.** Apothecia finally convex, thallus large, lobes up to 1 cm broad*L. cochleatum*
12b. Apothecia concave, thallus smaller..... 13
- 13a.** Thallus thin (c. 50 µm).....*L. moluccanum*
13b. Thallus thicker (c. 80 µm)..... *L. azureum*
- 14a.** Apothecia pedicellate on an inflated stipe*L. javanicum*
14b. Apothecia not pedicellate or absent 15
- 15a.** Thallus mostly lobate; apothecia flat and large*L. corticola*
15b. Thallus mostly pulvinate to anastomosing..... 16
- 16a.** Wrinkles fine, older apothecia with concentric wrinkles.....*L. bullatulum*
16b. Wrinkles coarser, apothecia without wrinkles 17
- 17a.** Wrinkles very coarse, larger than the areas in between.....*L. enkarodes*
17b. Wrinkles smaller than the areas inbetween.....*L. fallax*

- Lobaria Key (after Sipman, H. 2004).** The species of *Lobaria* (lichenized Ascomycetes) in New Guinea. *Bibliotheca Lichenologica* 88: 573-606.:
- 1a.** Photobiont bluegreen (Nostoc in glomerules), fresh thallus grey to brown when wet; medulla C- and KC-; thallus like *L. pulmonaria* (brownish, scrobiculate with reticulate ridges, tomentum at least in the central ridges black)..... 2
1b. Photobiont green (coccoid), fresh thallus green to brown when wet; medulla usually C+ or at least KC+ red; thallus like *L. pulmonaria* or different..... 4
- 2a.** Isidia present, cylindrical or applanate, mainly scattered on the ridges 3
2b. Isidia absent *L. pseudopulmonaria*
- 3a.** Central thallus ridges sharp (often higher than wide); medulla K+ yellow turning orange (stictic acid present), rarely K-.....*L. isidiosa*
3b. Central thallus ridges rounded; medulla K- (stictic acid absent)...*L. pseudoretigera*
- 4a.** Thallus *L. pulmonaria*-like, (brownish, scrobiculate with reticulate ridges, tomentum at least in the central grooves black); medulla K+ yellow turning orange (stictic acid present), rarely K-; cylindrical or flattened isidia present, marginal lobules absent..... 5
4b. Thallus different; medulla K- (stictic acid absent); isidia or marginal lobules present or absent 7
- 5a.** Medulla K+ yellow turning orange (stictic acid present), C+ red or C-, KC+ red or KC- (gyrophoric acid present or absent)..... 6
5b. Medulla K- (stictic acid absent), C+ red or at least KC+ red (gyrophoric acid present)..... *L. spathulata*

- 6a.** Medulla C+ red or at least KC+ red (gyrophoric acid present) *L. isidiophora*
- 6b.** Medulla C-, KC- (gyrophoric acid absent) *L. meridionalis*
- 7a.** Isidia or lobules present 8
- 7b.** Isidia and lobules absent 10
- 8a.** Marginal lobules present, fragile; thallus lobes flat or somewhat channeled; tomentum in + vein-like patches 9
- 8b.** Laminal, flattened, more or less lobule-like isidia present; thallus lobes shallowly scrobiculate and reticulate-ridged; tomentum equally dispersed or in reticulate pattern *L. hertelii*
- 9a.** Upper cortex 20-30 µm thick; ascospores 40-45 x 7-9 µm; tomentum patches pale; congyrophoric acid present *L. crassior*
- 9b.** Upper cortex 35-45 µm thick; ascospores 30-35 x 10-12 µm; tomentum patches blackish, vein-like; congyrophoric acid absent *L. clemensiae* var. *crassa*
- 10a.** Thallus scrobiculate to undulate, the depressions separated by wider or narrower, often reticulate ridges; tomentum largely restricted to the grooves 11
- 10b.** Thallus with shallow depressions or flat, sometimes slightly canaliculate or shallowly undulate, without reticulate ridges; tomentum more or less vein-like .. 13
- 11a.** Thallus ridges sharp and depressions often pit-like; congyrophoric acid absent. *L. dendrophora*
- 11b.** Thallus ridges widely rounded and depressions rounded; congyrophoric acid present or absent 12
- 12a.** Congyrophoric acid present; pycnidia immersed in flat thallus .. *L. subscrobiculata*
- 12b.** Congyrophoric acid absent; pycnidia raised, in prominent thallus warts *L. ferax*
- 13a.** Medulla C-, KC- (gyrophoric acid absent), K- or K+ dark violet 14
- 13b.** Medulla C+ red or at least KC+ red (gyrophoric acid present), K- 15
- 14a.** Medulla orange-brown, K+ dark violet *L. endochroma*
- 14b.** Medulla white, K- *L. discolor*
- 15a.** Thallus closely applanate, subirregularly lobed; congyrophoric acid present; proper exciple visible as a ring around the disc *L. adscripturiens*
- 15b.** Thallus loosely applanate, subirregularly or sublinearly lobed; congyrophoric acid absent; proper exciple not exposed *L. discolor*

Menegazzia Key (after James, P.W., A. Aptroot, P. Diederich, H.J.M. Sipman & E.

Sérusiaux 2001. New species in the lichen genus *Menegazzia* in New Guinea. *Bibliotheca Lichenologica* 78: 91-108.):

- 1a.** Thallus with numerous to very sparse vegetative propagules (soredia, pustules, isidia) or with small, often perforate, ± erect, finger-like or clavate extensions; rarely fertile 2
- 1b.** Thallus without vegetative propagules, but frequently with small lateral lobes or thallus extensions; usually at least sparingly fertile 9

- 2a.** Thallus truly isidiate or with small, finger-like or clavate extensions 3
2b. Thallus erose- or pustulate-sorediate 5
- 3a.** Lobes inflated, up to 5 mm wide; perforations confined to the lower cortex and to the upper cortex on lateral lobes or extensions; upper surface with patches of narrow, true, solid isidia which leave pits when shed..... *M. isidiata*
3b. Lobes not inflated, not exceeding 2.5 mm wide; perforations present in the upper cortex; hollow, finger-like or clavate extensions often present 4
- 4a.** Upper cortex weakly striate-ridged to roughened; lobes often becoming pendulous, pale grey; isidia elongat *M. pendula*
4b. Upper cortex smooth; lobes closely appressed, at least partly glossy brown; isidia elongate *M. digitiformis*
4c. Upper cortex smooth; lobes closely appressed; isidia globose *M. globoisidiata*
- 5a.** Upper cortex fragile, finely wrinkled, dissolving into ± effuse soredia; soralia laminal, becoming ± erose and confluent; usually containing barbatic acid, in addtlion to the stictic acid complex *M. dissoluta*
5b. Upper cortex firm, smooth or only faintly wrinkled, not dissolving into soredia; soralia or pustules delimited, often ± elevated; not containing barbatic acid; stictic acid complex present 6
- 6a.** Lobes inflated, not or sparingly branched, up to 5 mm wide; perforations confined to the lower cortex and to the upper cortex on lateral lobes or extensions; soralia scattered, often marginal, labriform or erumpent with markedly uneven, lacerate margins..... *M. efflorescens*
6b. Lobes not inflated, short or only somewhat elongate, often richly branched, up to 2.5 mm wide, upper cortex perforate; soralia or pustules sparse or abundant, usually formed on short, lateral lobe extensions 7
- 7a.** Thallus closely appressed; lobes in part pale yellowish, suffused brown to nearly black; soralia capitate, confined to central parts of the thallus, originating from marginal lobules; saxicolous *M. saxicola*
7b. Thallus not closely appressed; lobes not brown; soralia not capitate; rarely saxicolous 8
- 8a.** Thallus with fatty acids *M. faminensis*
8b. Thallus with stictic acid complex *M. malesiana* and/or (or =) *M. subsimilis*
8c. Thallus with fumarprotocetraric acid *M. menyamyensis*
- 9a.** Lobes inflated, sparingly branched; perforations restricted to lateral lobes or extensions on the upper cortex, present or nearly absent on the lower cortex..... 10
9b. Lobes not inflated, usually richly branched; perforations present only on the upper cortex 11
- 10a.** Lobes sparingly irregularly branched, up to 5 mm wide; perforations confined to the lower cortex and to the upper cortex of lateral lobes or extensions; lobes greyish, rarely brown or black-maculate; apothecia rather frequent; usually epiphytic; containing stictic acid complex..... *M. megathallina*

- 10b.** Lobes loosely interwoven or separate, not exceeding 2.5 mm wide; perforations very rare and irregular; lobes at least partly glossy brown, grey- or black-maculate; apothecia absent; terricolous, saxicolous or epiphytic at high elevations; containing physodic, physodalic and alectoronic acids. *Hypogymnia lugubris*
- 11a.** Thallus of numerous, intricately interwoven lobes up to 1.5 mm wide; apothecial margins with papilla-like projections..... *M. stellata*
- 11b.** Thallus variable, short-lobed (to 3 mm wide) or with ± elongate, somewhat radiating lobes; apothecial margins never with papilla-like projections **12**
- 12a.** Thallus with fatty acids..... *M. asekiensis*
- 12b.** Thallus with stictic acid complex *M. monospora*

Nephroma Key:

- 1a.** Margin of the apothecia with isidia, upper surface of the apothecia scabrid, pilose, thallus grey to brown *N. tropicum*
- 1b.** Margin of the apothecia broad, without isidia, upper surface smooth, thallus grey. *N. plumbeum*

Nephromopsis Key (after Randlane, T. & A. Saag 1998. Synopsis of the genus

Nephromopsis (fam. *Parmeliaceae*, lichenized *Ascomycota*). Cryptogamie, Bryologie et Lichénologie 19: 175-191.):

- 1a.** Apothecia laminal, always present *N. pallescens*
- 1b.** Apothecia marginal or absent *N. morrisonicola*

Pannaria Key (after Jørgensen, P.M. & H.J.M. Sipman 2006. The lichen family

Pannariaceae in the montane regions of New Guinea. Journal of the Hattori Botanical Laboratory 100: 695-720.):

- 1a.** Thallus with bluish gymnidia (isidia without cortex) *P. conoplea*
- 1b.** Thallus without gymnidia **2**
- 2a.** Thallus with isidia..... *P. prolificans*
- 2b.** Thallus without isidia, usually fertile..... **3**
- 3a.** Thallus with green photobiont and cephalodia **4**
- 3b.** Thallus with cyanobiont only..... **5**
- 4a.** Thallus dominated by large, spreading lobes with green photobiont, with cushions of globular cephalodia centrally..... *P. sphinctrina*
- 4b.** Thallus dominated by brittle, ascending, small squamules; green photobiont in the marginal squamules only *P. papuana*
- 5a.** Thallus gelatinous, swelling much when wet, strongly wrinkled when dry *P. lurida*
- 5b.** Thallus not gelatinous, not or shallowly wrinkled..... **6**
- 6a.** Thallus blue-green, foliose, with coarsely bundled marginal rhizohyphae; montane..... **7**

- 6b.** Thallus grey or brown, placodioid or crustose; rhizohyphae short and dense, not protruding beyond the thallus lobes, or forming a thick cushion; alpine..... **8**
- 7a.** Thallus lobes crenulate *P. molkenboeri*
7b. Thallus lobes linear, ca. 1 mm wide *P. tenuis*
- 8a.** Thallus grey-blue, nearly crustose, resting on a thick cushion of rhizohyphae. *P. andina*
8b. Thallus grey-brown, placodioid, with short, dense rhizohyphae underneath. *P. rubiginosa*

- Parmeliella** Key (after Jørgensen, P.M. & H.J.M. Sipman 2006. The lichen family Pannariaceae in the montane regions of New Guinea. Journal of the Hattori Botanical Laboratory 100: 695-720.):
- 1a.** Thallus with yellow or orange colours in the medulla..... **2**
1b. Thallus grey-brown or -blue, without yellow/orange medulla **3**
- 2a.** Thallus brown, with orange medulla, often fertile, on black, crustose prothallus; spores citriform *P. endoferruginea*
2b. Thallus grey with a yellowish hue, with yellow medulla, rarely fertile, sparingly isidiate; on black, spongy prothallus..... *P. flavida*
- 3a.** Thallus foliicolous, very thin (less than 100 µm) *P. foliicola*
3b. Thallus not foliicolous, thicker (over 100 µm) **4**
- 4a.** Apothecia with thalline margin..... **5**
4b. Apothecia only with proper margin **11**
- 5a.** Thallus very thick (200-400 µm) with prominent brownish rhizohyphae. *P. pannariooides*
5b. Thallus thinner (under 200 µm) with blackish or without rhizohyphae **6**
- 6a.** Thallus flat, without ascending lobes, resting on a prominent prothallus **7**
6b. Thallus cushion-forming, with at least some ascending lobes/squamules, prothallus less prominent **10**
- 7a.** Thallus with isidia..... **8**
7b. Thallus without isidia..... **9**
- 8a.** Isidia globose to gnarled *P. brisbanensis*
8b. Isidia cylindrical..... *P. papillata*
- 9a.** Thallus large (often over 5 cm diam.), on spongy prothallus; lowland... *P. mariana*
9b. Thallus smaller (not more than 5 cm diam.), on crustose prothallus; montane. *P. montana*
- 10a.** Thallus coralloid, usually shiny, in dense cushions *P. nitida*
10b. Thallus squamulose, dull, in loose cushions..... *P. polyphyllina*

- 11a.** Thallus with enlarged, radiating, marginal lobes *P. pindaundensis*
- 11b.** Thallus of more or less equal squamules 12
- 12a.** Thallus nearly crustose with neatly incised lobes resting on blackish, crustose prothallus *P. philippina*
- 12b.** Thallus distinctly squamulose, prothallus irregular or poorly developed 13
- 13a.** Thallus with numerous tiny lobules in lace pattern, apothecia with thick, permanent proper margin ($>100 \mu\text{m}$), spores with thin, warty perispore *P. laceroides*
- 13b.** Thallus mostly without lobules, forming flat rosettes, apothecia with thin proper margin, often excluded at maturity ($<100 \mu\text{m}$), spores with wider, smooth perispore *P. hawaiiensis*

Parmotrema Key (after Louwhoff, S.H.J.J. & J.A. Elix 1999. *Parmotrema* and allied lichen genera in Papua New Guinea. *Bibliotheca Lichenologica* 73: 1-152.):

- 1a.** Lower surface rhizinate to margins, or with or without a narrow (up to 1 mm wide), erhizinate zone 2
- 1b.** Lower surface with a broad, erhizinate marginal zone (to 1-1.5 cm wide) 5
- 2a.** Upper surface distinctly white-maculate and becoming reticulately-cracked; rhizines simple or squarrose 3
- 2b.** Sorediate; upper surface \pm irregularly cracked; rhizines dimorphous *P. subsumptum*
- 2c.** Isidiate; upper surface \pm irregularly cracked; rhizines dimorphous..*P. subtinctiorium*
- 3a.** Thallus sorediate; soredia marginal *P. reticulatum*
- 3b.** Thallus sorediate; soredia on vertical lobes *P. clavuliferum*
- 3c.** Thallus esorediate 4
- 4a.** Cortex rugose, conspicuously cracked and flaking off in patches *P. austrocetratum*
- 4b.** Cortex smooth, cracked but not flaking off *P. cetratum*
- 5a.** Thallus lacking soredia, isidia or pustules 6
- 5b.** Thallus sorediate, isidiate or pustulate 16
- 6a.** Medulla K+ yellow-brown; protocetraric acid present 7
- 6b.** Medulla K- or K+ yellow-orange; protocetraric acid absent 10
- 7a.** Fatty acids (protolichesterinic and lichesterinic) present; spores large (to 34 μm long) *P. elacinulatum*
- 7b.** Fatty acids absent; spores smaller (to 26 μm long) 8
- 8a.** Spores large, 26-32 μm long *P. pigmentosum*
- 8b.** Spores smaller, 18-26 μm long 9
- 9a.** Thallus membranaceous, rarely lacinate; spores 18-22 μm long; conidia sublageniform *P. overeemii*
- 9b.** Thallus coriaceous-membranaceous, lacinate; spores 24-26 μm long (or rarely larger); conidia not seen *P. merrillii*

- 10a.** Medulla K+ yellow-orange; colensoic and 4-O-methylphysodic acids present.....*P. menyamyaense*
- 10b.** Medulla K-; alectoronic acid present..... **11**
- 11a.** Cilia inconspicuous; diffractaic acid present *P. praeinsuetum*
- 11b.** Cilia conspicuous; alectoronic acid present..... **12**
- 12a.** Thallus blackened, strongly maculate *P. nilgherrense*
- 12b.** Thallus rarely blackened, emaculate or only faintly maculate **13**
- 13a.** Thallus distinctly membranaceous; lobes imbricate, lobulate-laciniate.
..... *P. subrugatum*
- 13b.** Thallus membranaceous to coriaceous, lobes non-imbricate, laciniae absent..... **14**
- 14a.** Thallus membranaceous to coriaceous; spores 30-35 µm long; conidia filiform.
..... *P. corniculans*
- 14b.** Thallus coriaceous; spores 12-26 µm long; conidia sublageniform **15**
- 15a.** Lobes suberect; spores 12-15 µm long *P. maclayanum*
- 15b.** Lobes flat, often deeply divided; spores 22-26 µm long *P. durumae*
- 16a.** Thallus isidiate; isidia cylindrical, wart-like or becoming sorediate **17**
- 16b.** Thallus sorediate and/or pustulate; isidia absent **34**
- 17a.** Lobes eciliate **18**
- 17b.** Lobes ciliate **25**
- 18a.** Medulla C+ pale pink or red; gyrophoric or lecanoric acids present..... **19**
- 18b.** Medulla C-; gyrophoric and lecanoric acids absent..... **20**
- 19a.** Medulla white; lecanonc acid present; pigments absent..... *P. tinctorum*
- 19b.** Medulla pale yellow; gyrophoric acid and pigments (eumitrins) present.
..... *P. kurokawianum*
- 20a.** Medulla pigmented brownish-pink throughout; protocetraric acid absent **21**
- 20b.** Medulla white throughout; protocetraric acid present **22**
- 21a.** Isidia syncorticate at apices; secalonic acids B & C present *P. lambleyi*
- 21b.** Isidia epicorticate at apices; eumitrins A1, A2, A3 present..... *P. sipmanii*
- 22a.** Upper surface grey to grey-green; usnic acid absent..... **23**
- 22b.** Upper surface yellow-green; usnic acid present **24**
- 23a.** Patches of medullary pigment (euplectin) present; rhizines long and slender.
..... *P. watutense*
- 23b.** Medullary pigment absent; rhizines short and coarse..... *P. saccatilobum*
- 24a.** Isidia brown- or black-tipped; medulla KC+ brick red; malonprotocetraric and
protocetraric acids present *P. malonprotocetraricum*

- 24b.** Isidia pale-tipped; medulla KC-; malonprotocetraric acid absent *P. pacificum*
- 25a.** Medulla intense sulphur yellow or orange throughout; vulpinic acid present. *P. sulphuratum*
- 25b.** Medulla mostly white **26**
- 26a.** Lichexanthone (UV+ gold) and salazinic acid present *P. ultralucens*
- 26b.** Lichexanthone and salazinic acid absent **27**
- 27a.** Isidia wart-like, ciliate *P. verrucatum*
- 27b.** Isidia cylindrical, coralloid-branched, becoming sorediate and/or ciliate; not wart-like..... **28**
- 28a.** Isidia eciliate **29**
- 28b.** Isidia ciliate **30**
- 29a.** Isidia becoming ± subsorediate; medulla KC-, P-; diffractaic acid present. *P. isidioinsuetum*
- 29b.** Isidia intact; medulla KC+ pink-red, P+ deep orange-red; protocetraric acid present *P. kaisenikianum*
- 30a.** Isidia eventually becoming granular- sorediate **31**
- 30b.** Isidia ±fragile but not becoming sorediate..... **32**
- 31a.** Medulla K+ bright yellow; stictic acid present *P. crinitum*
- 31b.** Medulla K-; alectoronic, a-collatolic acids present *P. mellissii*
- 32a.** Cilia mostly to 1 mm long; lobules present; alectoronic and a-collatolic acids present *P. nanfongensis*
- 32b.** Cilia greater than 1 mm long; lobules absent; alectoronic and a-collatolic acids absent **33**
- 33a.** Medulla C-, KC- or KC+ brownish, P+ deep orange-red; fumarprotocetraric and succinprotocetraric acids present; cilia 2-5 mm long *P. acrotrychum*
- 33b.** Medulla C-, KC+ reddish, P+ brick red; protocetraric and protolichesterinic acids present; cilia 1.5-3 mm long *P. subcorallinum*
- 34a.** Thallus pustulate, ±sorediate **35**
- 34b.** Thallus sorediate; pustules absent..... **36**
- 35a.** Medulla pale yellow (eumittrin A1); pustules esorediate *P. kainantum*
- 35b.** Medulla white; pustules sorediate..... *P. madilynae*
- 36a.** Lobes eciliate **37**
- 36b.** Lobes ciliate **42**
- 37a.** Medulla K+ bright yellow turning bright red; salazinic acid present .. *P. cristiferum*
- 37b.** Medulla K- or K+ dirty yellow; salazinic acid absent **38**
- 38a.** Medulla P-; fatty acid present (praesorediosic acid)..... *P. praesorediosum*

- 38b.** Medulla P+ deep orange-red; fatty acid absent; protocetraric or succinprotocetraric acid present..... **39**
- 39a.** Soralia situated on elaborate, coralloid-branched laciniae *P. naonii*
- 39b.** Soralia linear and marginal, submarginal, or subcapitate; coralloid-branched laciniae absent..... **40**
- 40a.** Diffractaicacid present..... *P. insuetum*
- 40b.** Diffractaic acid absent **41**
- 41a.** Thallus 10 cm or more wide; medullary pigments present; echinocarpic and usnic acids present..... *P. dilatatum*
- 41b.** Thallus up to 7 cm wide; medulla white; usnic and echinocarpic acids absent.
..... *P. gardneri*
- 42a.** Medulla K+ bright yellow turning bright red; salazinic acid present.. *P. cristiferum*
- 42b.** Medulla K- or K+ dirty yellow; salazinic acid absent **43**
- 43a.** Soralia punctiform or on elaborate, coralloid-branched laciniae..... **44**
- 43b.** Soralia punctiform or not, linear and marginal, submarginal, or subcapitate; coralloid-branched laciniae absent..... **45**
- 44a.** Medulla partly pigmented deep orange (euplectin); alectoronic acid present.
..... *P. hypomiltoides*
- 44b.** Medulla white; protocetraric acid present..... *P. fasciculatum*
- 45a.** Medulla K+ bright yellow; stictic acid present..... *P. perlatum*
- 45b.** Medulla K- or K+ dirty yellow; stictic acid absent **46**
- 46a.** Medulla C+ red **47**
- 46b.** Medulla C- **49**
- 47a.** Lecanoric acid (major) present; gyrophoric acid absent..... *P. cooperi*
- 47b.** Gyrophoric acid (major) present; ± lecanoric acid (trace)..... **48**
- 48a.** Medulla UV-, white throughout, or if pigmented, K+ purple (skyrin).
..... *P. sancti-angelii*
- 48b.** Medulla UV-, yellow or pink-salmon in lower part; pigmented medulla K-.
..... *P. permutatum*
- 48c.** Medulla usually UV+ greenish white; thallus maculate *P. lobulascens*
- 49a.** Medulla UV-or + white; protocetraric acid and/or succinprotocetraric acid present; alectoronic sometimes present **50**
- 49b.** Medulla UV+ white; alectoronic acid and/or a-collatolic acid present **55**
- 50a.** Succinprotocetraric acid (major) and protocetraric acid (minor) present.
..... *P. flaccidifolium*
- 50b.** Protocetraric acid present; succinprotocetraric acid absent **51**
- 51a.** Cilia conspicuous, moderate to dense, more than 2 mm long **52**

- 51b.** Cilia sparse, sometimes restricted to lobe axils and damaged margins only, up to 1.5 µm long 53
- 52a.** Alectoronic acid present; cilia 2-4(-7) mm long *P. deflectens*
- 52b.** Alectoronic acid absent; cilia 2-6(-10) mm long *P. subarnoldii*
- 53a.** Echinocarpic acid present in medulla; ± usnic acid (minor/trace) present in cortex. *P. dilatatum*
- 53b.** Echinocarpic acid and usnic acid absent 54
- 54a.** Thallus membranaceous, often partly blackened or discoloured; soralia mainly subcapitate on laciniae *P. robustum*
- 54b.** Thallus coriaceous, not blackened; soralia mainly linear and marginal or punctiform and submarginal *P. gardneri*
- 55a.** Thallus membranaceous, usually partly blackened; spores 27-35 µm long. *P. gloriosum*
- 55b.** Thallus coriaceous, not obviously blackened; spores 10-12 µm long 56
- 56a.** Cilia up to 3 mm long; medulla white; skyrin absent; lobes 10-20 mm wide (or rarely smaller) *P. poolii*
- 56b.** Cilia 3-6 mm long; medulla ± pigmented, containing skyrin; lobes 5-15 mm wide (or rarely larger) *P. rampoddense*

Peltigera Key (after Sérusiaux, E., B. Goffinet, J. Miadlikowska & O. Vitikainen 2009).

Taxonomy, phylogeny and biogeography of the lichen genus Peltigera in Papua New Guinea. Fungal Diversity 38: 185-224.):

- 1a.** Soredia or soredioid masses present, at least in parts of the thallus 2
- 1b.** Soredia or soredioid masses absent 7
- 2a.** Upper surface tomentose, at least in parts; soralia mostly laminal, or submarginal on old thalli 3
- 2b.** Upper surface glabrous; soralia laminal, submarginal or marginal 4
- 3a.** Rhizines abundant, densely branched to fibrillose; young soralia C+ red *P. extenuata*
- 3b.** Rhizines sparse, simple to loosely branched; soralia C- *P. didactyla*
- 4a.** Genuine soralia only 5
- 4b.** Genuine soralia present but always with soredioid or isidioid masses, or with granules or phyllidia. 6
- 5a.** Soralia mostly laminal, or submarginal and marginal; terpenoids absent *P. ulcerata*
- 5b.** Soralia strictly marginal; terpenoids present *P. weberi*
- 6a.** Margins disrupted into soralia, soredioid or isidioid masses, or with granules or phyllidia; terpenoids present with zeorin always abundantly produced; thalli usually quite large, reaching 10 cm in diam *P. cichoracea*

- 6b.** Margins with soralia or isidioid masses, when welldeveloped also present on the edge of the lower surface; terpenoids absent; thalli usually quite small, not exceeding 2-5 cm in diam *P. granulosa*
- 7a.** Marginal lobules or phyllidia present 8
7b. Marginal lobules or phyllidia absent 9
- 8a.** Upper surface smooth or faintly to distinctly scabrous, sometimes with a whitish pruina near the lobes margins resulting in a frosted appearance, lobes carrying the apothecia usually tomentose; marginal phyllidia usually abundant, but sometimes few; lower surface with a conspicuous network of usually dark, raised veins; rhizines mostly threadlike or penicillate; apothecia typically horizontal; terpenoids absent *P. papuana*
- 8b.** Upper surface smooth, rarely with a whitish pruina on lobes margins; marginal phyllidia rare (on lateral lobes or on damaged parts); lower surface usually lacking distinct veins; rhizines typically fasciculate and densely branched, remaining isolate and arranged in concentrical rows or forming dense cushions under the thallus; apothecia typically saddle-shaped; terpenoids present.
..... *P. sumatrana* (rare forms)
- 9a.** Upper surface tomentose, at least in parts; terpenoids absent 10
9b. Upper surface glabrous or pruinose (in parts or at the extremities of young lobes); terpenoids present or absent 13
- 10a.** Rhizines usually very abundant and forming dense 'bushy' masses, typically fibrillose to coralloid; apothecia saddle-shaped *P. koponenii*
- 10b.** Rhizines abundant or not, simple, threadlike, penicillate or fasciculate, never fibrillose to coralloid; apothecia horizontal or saddle-shaped 11
- 11a.** Apothecia typically horizontal; pycnidia absent, or rare and inconspicuous; tomentum covering large parts of the thallus, or restricted to lobes carrying the apothecia 12
11b. Apothecia typically saddle-shaped; pycnidia usually present, at least on some lobes margins, conspicuous (0.3-0.8 mm in diam.); tomentum of the upper surface most usually well-developed, but sometimes absent in parts of the thallus, with long and conspicuous (to 1-1.4 mm long) hairs or not *P. fimbriata*
- 12a.** Thallus large, to 15 cm in diam., lobes typically rounded at their extremities and 1-1.5 cm wide, margin revolute; tomentum present on most of the upper surface made of tiny whitish hairs (0.1-0.15 mm high) out of which longer ones (0.1-0.4 mm long) may emerge *P. erioderma*
- 12b.** Thallus forming attractive, small rounded rosettes (3-6 cm in diam. in suitable conditions); lobes imbricate, not exceeding 0.5-0.7 cm wide, with raised and crenate (sometimes +/- crisped) margins; tomentum usually restricted to lobes carrying apothecia but sometimes covering large parts of the thallus surface.
..... *P. papuana* (rare forms)
- 13a.** Apothecia typically horizontal; terpenoids absent *P. montis-wilhelmii*
13b. Apothecia saddle-shaped or absent; terpenoids present 14

- 14a.** Tenuiorin and methylgyrophorate absent but terpenoids present; upper surface smooth, sometimes slightly pruinose at the margins or incrusted; lobes with raised and crisped lateral margins *P. oceanica*
- 14b.** Tenuiorin and methylgyrophorate always produced, together with terpenoids..... **15**
- 15a.** Rhizines abundant, or rarely sparse, rather short, fasciculate or densely branched. **16**
- 15b.** Rhizines sparse or abundant, most usually long and simple..... **17**
- 16a.** Terpenoids present, mostly zeorin or peltidactylin but dolichorrhizin not produced *P. dolichorhiza*
- 16b.** Terpenoids present, dolichorrhizin abundantly produced..... *P. sumatrana*
- 17a.** Thallus robust, not distinctly undulating; lower surface with a dense network of unraised, dark veins with distinct rather small, elliptical, whitish interstices; upper surface usually with pruina at the lobes margins and sometimes with large and conspicuous incrusted patches; dolichorrhizin as the main terpenoid produced; terricolous *P. nana*
- 17b.** Thallus fragile, with a distinctly undulating surface with shallow depressions, at least in well-developed specimens; lower surface with a loose network of raised, pale to dark veins with large, elliptical, whitish to pale orange interstices; terpenoids produced in several chemotypes; mostly epiphytic, rarely on rotten wood or on terricolous mosses..... *P. dolichorhiza*

Phaeophyscia Key:

- 1a.** Thallus without pigment in the medulla *P. hispidula*
- 1b.** Thallus with medullary pigment **2**
- 2a.** Medullary pigment yellow *P. crocea*
- 2b.** Medullary pigment red..... *P. endococcinodes*

Physcia Key:

- 1a.** Thallus without vegetative propagules **2**
- 1b.** Thallus with isidia or soredia..... **3**
- 2a.** Thallus maculate, saxicolous *P. phaea*
- 2b.** Thallus not maculate, corticolous *P. verrucosa*
- 3a.** Thallus with true isidia..... *P. vermicula*
- 3b.** Thallus with soredia or isidioid soredia..... **4**
- 4a.** Lower surface black..... **5**
- 4b.** Lower surface white to brownish..... **6**
- 5a.** Lower surface striate, soredia mainly marginal..... *P. atrostriata*
- 5b.** Lower surface not striate..... **6**
- 6a.** Upper surface bluish pruinose, soredia punctiform *P. krogiae*

- 6b.** Upper surface grey, not pruinose, soredia otherwise 7
- 7a.** Soredia marginal, sometimes isidiod *P. sorediosa*
- 7b.** Soredia laminal *P. erumpens*
- 8a.** Soredia laminal 9
- 8b.** Soredia marginal 10
- 9a.** Soralia crateriform, corticolous *P. poncinsii*
- 9b.** Soralia capitate, saxicolous *P. alboplumbea*
- 10a.** Upper surface not pruinose *P. tribacoides*
- 10b.** Upper surface haevily pruinose *P. dimidiata*

Physma Key:

- 1a.** Thallus with apothecia *P. byrsaeum*
- 1b.** Thallus with pseudoisidia *P. pseudoisidiatum*

Polychidium Key:

- 1a.** Algae Nostoc (with globose cells in chains) *P. muscicola*
- 1b.** Algae Scytonema (with cylindrical cells in chains) 2
- 2a.** Cortex cells meandering, jig-saw-shaped; thallus shiny *P. stipitatum*
- 2b.** Cortex cells rather regular, ultimate thallus branches dull *P. dendriscum*

Pseudocyphellaria Key (modified after Galloway, D.J. 1994. Studies in *Pseudocyphellaria*

IV. Paleotropical species (excluding Australia). Bulletin of the British Museum (Natural History), Botany 24: 115-159.):

- 1a.** Photobiont green 2
- 1b.** Photobiont blue-green (Nostoc in chains) 10
- 2a.** Medulla yellow 3
- 2b.** Medulla white (note: pseudocyphellae or soredia could be yellow) 6
- 3a.** Without soredia, isidia or phyllidia *P. clathrata*
- 3b.** Sorediate, isidiate or phyllidiate 4
- 4a.** Isidiate to phyllidiate only *P. pickeringii*
- 4b.** Sorediate (isidia may also be present) 5
- 5a.** Soredia partly linear *P. aurata*
- 5b.** Soredia formed on punctiform isidia *P. poculifera*
- 6a.** Pseudocyphellae yellow *P. carpoloma*
- 6b.** Pseudocyphellae white 7
- 7a.** Pseudocyphellae present on upper and lower surface *P. reineckiana*

7b.	Pseudocyphellae present only on lower surface	8
8a.	Without soredia, isidia or phyllidia.....	<i>P. sulphurea</i>
8b.	Isidiate or phyllidiate	9
9a.	Lobes broad, rounded, phyllidiate	<i>P. multifida</i>
9b.	Lobes narrow, punctate, isidiate to phyllidiate	<i>P. prolificans</i>
10a.	Pseudocyphellae yellow.....	11
10b.	Pseudocyphellae white.....	16
11a.	Without soredia, isidia or phyllidia.....	12
11b.	Sorediate, isidiate or phyllidiate	13
12a.	Upper surface faveolate, sometimes also maculate	<i>P. maculata</i>
12b.	Upper surface undulate only.....	<i>P. gilva</i>
13a.	Isidiate to phyllidiate.....	14
13b.	Sorediate	<i>P. crocata</i>
14a.	Isidiate.....	<i>P. desfontainii</i>
14b.	Phyllidiate or with proliferations	15
15a.	Phyllidiate	<i>P. neglecta</i>
15b.	With proliferations	<i>P. crocatoides</i>
16a.	Without soredia, isidia or phyllidia.....	17
16b.	Sorediate or isidiate or phyllidiate	20
17a.	Pseudocyphellae present on upper and lower surface.....	18
17b.	Pseudocyphellae present only on lower surface	<i>P. beccarii</i>
18a.	Upper surface scrobiculate.....	<i>P. rigida</i>
18b.	Upper surface plane	19
19a.	Lobe margins tomentose	<i>P. trichophora</i>
19b.	Lobe margins glabrous.....	<i>P. semilanata</i>
20a.	Isidiate to phyllidiate.....	21
20b.	Sorediate	24
21a.	Phyllidiate	22
21b.	Isidiate.....	23
22a.	Pseudocyphellae present on upper and lower surface, surface plane .	<i>P. punctillaris</i>
22b.	Pseudocyphellae present only on lower surface; upper surface pitted ...	<i>P. insculpta</i>
23a.	Isidia associated with pseudocyphellae	<i>P. argyracea</i>
23b.	Isidia not associated with pseudocyphellae	<i>P. dissimilis</i>

- 24a.** Upper surface faveolate to pitted *P. dozyana*
24b. Upper surface undulate only *P. intricata*

Pyxine Key:

- 1a.** Thallus without vegetative propagules **2**
1b. Thallus with vegetative propagules **8**
- 2a.** Medulla yellow **3**
2b. Medulla white **4**
- 3a.** Upper surface UV- *P. limbulata*
3b. Upper surface UV+ yellow *P. berteriana*
- 4a.** Upper surface UV- **5**
4b. Upper surface UV+ yellow **7**
- 5a.** Lobes convex *P. convexior*
5b. Lobes flat **6**
- 6a.** Medulla K-, P+red *P. schmidtii*
6b. Medulla K+ red *P. philippina*
- 7a.** Lobes pruinose, corticolous *P. petricola*
7b. Lobes epruinose, saxicolous, small-lobed *P. minuta*
- 8a.** Thallus with isidia **9**
8b. Thallus with soredia or pustules **10**
- 9a.** Medulla yellow *P. isidiolenta*
9b. Medulla white *P. cylindrica*
- 10a.** Medulla yellow **11**
10b. Medulla white to pale ochraceous **14**
- 11a.** Upper surface UV+ yellow *P. subcinerea*
11b. Upper surface UV- **12**
- 12a.** Pseudocyphellae (nearly) absent *P. meissnerina*
12b. Pseudocyphellae marginal, conspicuous **13**
- 13a.** Soredia granular, marginal, bluish, isidioid *P. sorediata*
13b. Soredia farinose, laminal *P. farinosa*
- 14a.** Thallus UV+ yellow *P. cocoes*
14b. Thallus UV- **15**
- 15a.** Soredia pustular/isidioid (polysidiangia) *P. retirugella*
15b. Soredia farinose, round *P. copelandii*

Ramalina Key:

- 1a. Thallus with soredia 2
1b. Thallus without soredia 4
- 2a. Thallus hollow *R. tenella*
2b. Thallus solid 3
- 3a. Soralia punctiform *R. peruviana*
3b. Soralia rounded *R. nervulosa*
- 4a. Thallus hollow 5
4b. Thallus solid 6
- 5a. Thallus less than 1 mm thin, apothecia rare *R. javanica*
5b. Thallus thicker, irregular, apothecia common *R. inflata*
- 6a. Thallus canaliculate to flattened 7
6b. Thallus subterete *R. tropica*
- 7a. disc margin with white lines *R. subfraxinea*
7b. disc margin without white lines *R. conduplicans*

Relicina Key (extracted from Elix, J.A. 1996a. A revision of the lichen genus *Relicina*.

Bibliotheca Lichenologica 62: 1-150.):

- 1a. Thallus isidiate and/or lobulate 2
1b. Thallus not isidiate or lobulate 14
- 2a. Isidia globose to cylindrical 3
2b. Isidia dorsiventral, becoming lobulate, or lobules only 8
- 3a. Lower surface pale brown to dark brown 4
3b. Lower surface black, rarely brown-black at lobe margins 5
- 4a. Rhizines simple or sparingly branched *R. sydneyensis*
4b. Rhizines with secondary rhizines which are densely branched and agglutinated *R. circumnodata*
- 5a. Lobes very narrow and tightly adnate, 0.3-1.0 mm wide *R. amphithrix*
5b. Lobes broader, adnate, 1-3 mm wide 6
- 6a. Medulla K+ intense yellow (or orange) or yellow turning red; containing stictic or norstictic acids *R. abstrusa*
6b. Medulla K-, or K+ pale yellow, containing 4-O-demethylbarbatic, echinocarpic or gyrophoric acids 7
- 7a. Medulla P+ yellow or orange, containing echinocarpic acid *R. planiuscula*
7b. Medulla P-, containing gyrophoric acids *R. vinasii*

- 8a.** Isidia present 9
8b. Isidia absent 11
- 9a.** Lobes narrow, tightly adnate, 0.3-1.0 mm wide *R. amphithrix*
9b. Lobes broader, adnate, 1-3.5 mm wide 10
- 10a.** Thallus coriaceous; apothecia ecoronate *R. planiuscula*
10b. Thallus fragile; apothecia subcoronate *R. schizospatha*
- 11a.** Lobes narrow, tightly adnate, 0.3-1.5 mm wide 12
11b. Lobes broader, adnate, 1-3.5 mm wide 13
- 12a.** Medulla P+ yellow or orange, containing echinocarpic acid *R. palmata*
12b. Medulla P-, containing relicinulinic acids A, B *R. relicinula*
- 13a.** Medulla P+ yellow or orange; containing echinocarpic acid, ±gyrophoric acid (trace) *R. gemmulosa*
13b. Medulla P-, C+ rose; containing gyrophoric acid (major), echinocarpic acid absent *R. luteoviridis*
- 14a.** Lower surface pale brown to dark brown 15
14b. Lower surface black, rarely brown-black at lobe margins 17
- 15a.** Medulla P-; containing barbatic acid *R. agglutinata*
15b. Medulla P+ red-orange; containing protocetraric, fumarprotocetraric or succinprotocetraric acids 16
- 16a.** Spores small, ca. 3 x 2 µm; containing succinprotocetraric acid major), himarprotocetraric acid (minor) *R. ramosissima*
16b. Spores larger; containing protocetraric acid (major) *R. sublanea*
- 17a.** Apothecia present, coronate or subcoronate 18
17b. Apothecia ecoronate or absent 23
- 18a.** Medulla K+ yellow then red; containing norstictic acid *R. subabstrusa*
18b. Medulla K- or K+ yellow; norstictic acid absent 19
- 19a.** Lobes broad, 1-3 mm wide; adnate; containing gyrophoric acid (major) *R. retrospinosa*
19b. Lobes narrow, 0.3-1.5 mm wide; tightly adnate; gyrophoric acid absent or present in traces only 20
- 20a.** Medulla P- 21
20b. Medulla P+ yellow, orange or red 22
- 21a.** Hirtifructic acid present *R. fijiensis*
21b. Hirtifructic acid absent *R. relicinula*
- 22a.** Lobes separate, axils broad; with gyrophoric and echinocarpic acid ... *R. samoensis*

- 22b.** Lobes separate, axils broad; with hypostictic acid..... *R. diederichii*
- 22c.** Lobes contiguous, axils acute; containing hirtifructic acid *R. terricrocodila*
- 23a.** Medulla P-..... **24**
- 23b.** Medulla P+ yellow, orange or red **25**
- 24a.** Medulla UV+ blue-white; containing alectoronic acid..... *R. fluorescens*
- 24b.** Medulla UV-; containing protolichesterinic acid, butlerins A, B, C *R. connivens*
- 25a.** Medulla P+ brick red; containing fumarprotocetraric acid..... *R. malesiana*
- 25b.** Medulla P+ yellow or orange; containing echinocarpic acid **26**
- 26a.** Medulla C+ rose or red; gyrophoric and hirtifructic acids present..... *R. hirtifructa*
- 26b.** Medulla C-; gyrophoric and hirtifructic acids absent..... **27**
- 27a.** Lobes broad, 1.5-3 mm wide; upper cortex columnar *R. columnaria*
- 27b.** Lobes narrow, 0.5-1 mm wide; upper cortex not columnar *R. sipmanii*

Relicinopsis Key:

- 1a.** Thallus with soredia..... *R. malaccensis*
- 1b.** Thallus without vegetative propagules *R. intertexta*

Siphula Key:

- 1a.** Branching dichotomous *S. dichotoma*
- 1b.** Branching irregular, sparse *S. decumbens*

Stereocaulon Key (after Sipman, H.J.M. 1998). Notes on the lichen genus *Stereocaulon* in New Guinea. Cryptogamie, Bryologie et Lichénologie 19: 229-245.):

- 1a.** Phyllocladia wart-like or applanate to squamulose, rarely cylindrical; cephalodia not corticate, or absent **2**
- 1b.** Phyllocladia cylindrical, sometimes coraloid-branched; cephalodia corticate..... **4**
- 2a.** Soredia present, mealy, usually produced on the lower side of expanded pseudopodetium apices; lobaric acid present, occasionally absent *S. leprocauloides*
- 2b.** Soredia absent (however, cf. remark under *S. graminosum*) **3**
- 3a.** Phyllocladia wart-like to peltate; stictic acid present *S. graminosum*
- 3b.** Phyllocladia wart-like to cylindrical; lobaric acid present *S. glareosum*
- 3c.** Phyllocladia wart-like to squamulose; stictic or colensoic acid present, occasionally both absent *S. myriocarpum*
- 4a.** Cephalodia more or less applanate and cristate, blue-grey with white lines or dots (pseudocyphellae) on the ridges..... *S. pseudomassartianum*
- 4b.** Cephalodia rounded to wrinkled, blue-grey without white spots or completely white (without pseudocyphellae) **5**

- 5a.** Phyllocladia mainly basal, absent from most of the pseudopodetia; cephalodia usually white and with a granular surface; perlatolic acid present; on alpine rocks..... *S. staufferi*
- 5b.** Phyllocladia present all over the pseudopodetia; cephalodia blue-grey, sometimes with a brownish tinge, with a smooth surface; perlatolic acid absent; on alpine rocks or otherwise 6
- 6a.** Apothecia mainly lateral on short branchlets along upper half of the pseudopodetia; above 3000 m..... *S. flabellatum*
- 6b.** Apothecia mainly terminal, in furcately branched groups, sometimes with additional lateral ones along the apical ramifications; c. 2000-4000 m 7
- 7a.** Pseudopodetia slender, 0.5-1(-1.2) mm thick; widespread in mountains from c. 2000-4000 m *S. massartianum*
- 7b.** Pseudopodetia stout, 1.2-2 mm thick; above c. 3500 m only *S. brassii*

Sticta Key (some additional species are reported, but not seen by me):

- 1a.** Algae green 2
- 1b.** Algae bluegreen, lobe margins with or without lobules 4
- 2a.** Thallus stipitate 3
- 2b.** Thallus not stipitate *S. variabilis*
- 3a.** Lobe margins entire *S. sayeri*
- 3b.** Lobe margins with lobules *S. myrioloba*
- 4a.** Thallus stipitate 5
- 4b.** Thallus not stipitate 11
- 5a.** Thallus with lobules or isidia 6
- 5b.** Thallus without lobules or isidia 8
- 6a.** Isidia laminal 7
- 6b.** Lobules present, marginal *S. marginifera*
- 7a.** Lobes narrow, branched *S. cyphellulata*
- 7b.** Lobes rounded, unbranched *S. brevipes*
- 8a.** Lobes narrow, branched 9
- 8b.** Lobes broad, nearly unbranched, thallus often small 10
- 9a.** Margin with black cilia *S. fimbriata*
- 9b.** Margin without cilia *S. leami*
- 10a.** Thallus foveate *S. heppiana*
- 10b.** Thallus mostly smooth *S. boschiana*
- 11a.** Thallus with soredia *S. sublimbata*
- 11b.** Thallus without soredia 12

12a. Margins incised, on rock in alpine area *S. alpinotropica*
12b. Margins with isidia or lobules, not incised **13**

13a. Margins with cylindrical isidia *S. weigeliae*
13b. Margins with flattened lobules; alpine *S. xanthotropa*

Thamnolia Key:

1a. Thallus hollow *T. vermicularis*
1b. Thallus solid *T. juncea*

Usnea Key (after Stevens, G.N. 1999. A revision of the lichen family Usneaceae in Australia.

Bibliotheca Lichenologica 72.):

1a. Axis hollow *U. baileyi*
1b. Axis solid **2**

2a. Plant pendulous **3**
2b. Plant shrubby **5**

3a. Main branches with erose cortex, not angular *U. longissima*
3b. Main branches with smooth cortex, but angular **4**

4a. Axis yellow *U. himantodes*
4b. Axis whitish *U. hossei*

5a. With soredia or isidia **6**
5b. Without soredia or isidia **10**

6a. Plant partly red *U. rubicunda*
6b. Plant greyish to yellowish **7**

7a. With isidia *U. dasaea*
7b. With soredia **8**

8a. Branches inflated *U. perplexans*
8b. Branches not inflated **9**

9a. Medulla P+ yellow, with psoromic acid *U. pycnoclada*
9b. Medulla P- or + red, with other acids *U. bismolliuscula*

10a. Thallus soft, nearly without papillae *U. flexilis*
10b. Thallus firm, with many papillae *U. molliuscula*

Xanthoparmelia Key:

1a. Thallus grey *X. atrocapnodes*
1b. Thallus yellowish green **2**

- 2a. Not isidiate *X. incerta*
- 2b. Thallus isidiate 3

- 3a. Thallus narrow, closely appressed *X. mougeotina*
- 3b. Thallus wider, loosely appressed 4

- 4a. Salazinic acid the main substance *X. isidiigera*
- 4b. Norstictic acid the main substance *X. neotinctina*

Xanthoria Key:

- 1a. Thallus sorediate, yellow *X. candelaria*
- 1b. Thallus not sorediate, orange *X. elegans*

2. Checklist of the lichens and lichenicolous fungi reported up to 2009 from Papua New Guinea

Based on published reports, both in print and on the internet. It lists only currently accepted records, and omits first reports when they have been shown to be erroneous. Some groups, like Sticta, still include unreliable reports, others like Arthoniaceae, Ramalinaceae, Micareaceae and Graphidaceae are still very incomplete judging from the numerous unidentified samples. The present list contains 1418 species, an increase of 185 % since the last published checklist (Streimann 1986).

Psoroglaena Diederich 1988.

Rejected records:

This includes all old records not accepted by Streimann (1986) and all species of the genus Anzia not accepted by Yoshimura, Sipman & Aptroot (1995), Bryoria by Hawksworth (in his review of Streimann (1986) in Lichenologist), Bunodophoron and Calicium by Tibell (1987, sub Sphaerophorus), Cladonia by Stenroos (various pubs.), Lecanora by Lumbsch (various papers), Pertusaria by Archer & Elix (various papers), pannarioids by Jorgensen & Sipman (various papers), and Usnea by Stevens (1999), Anthracothecium, Arthopyrenia and Pyrenula by Aptroot et al. (1997); furthermore a few species of Baeomyces and Heterodermia are omitted because they are doubtlessly wrong.

Additional information about rejected records:

- Catolechia wahlenbergii: the specimen (seen in LAE) is Arthroraphis alpina
 Cetrariopsis wallichiana: wrong report, due to confusion with the heterotypic Parmelinella wallichiana
 Dactylina arctica: probably Thamnolia
 Hypogymnia bitteri: erroneous report
 Leptorhaphis novaeguineae: the type is lost, it may have been a Celothelium
 Melanotheca achariana: a Pyrenula
 Menegazzia terebrata: an undescribed species

Microphiale agyrothalamia: type to be studied
Microthelia thelena: the specimen is *Mycomicrothelia obovata* (see Aptroot 1991)
Mycomicrothelia miculiformis: erroneous report
Myxodictyon subcaeruleum: no idea what this is
Nephroma helveticum: identical with *N. tropicum*
Nephromopsis nephromoides (Nyl.) Ahti & Randlane (as *ectocarpisma* (Hue) Gyelnik) Streimann 1990, not cited by Randlane & Saag 1998.
N. stracheyi (Church. Bab.) Müll. Arg. Lambley 1991, not cited by Randlane & Saag 1998.
Ochrolechia frigida: this is *Lecanora novaeguineae*
Parmelia curtata: this is an *Everniastrum* (chemical strain)
Porina epiphyloides: this is *P. minutissima*.
Pseudopyrenula limitata: the type is lost, it may have been *Trypethelium tropicum*
Pyrenula ochracea: the type is lost
